Introduction

The nature and purpose of *Journal Citation Reports®* (*JCR™*) is described in this introduction. The introduction includes a reprint of an article on the background of the *JCR* that will supplement information given here. A selective bibliography on citation analysis and its applications follows the reprint. A list of *Abbreviated-to-Full Titles of Citing/Cited Journals* completes the introductory material.

I. Journals, References, and Citations

A citation index is based on the principle that there is some meaningful relationship between one paper and some other that it cites or that cites it, and thus between the work of the two authors or two groups of authors who published the papers.

The entire *SCI®* data base is stored on magnetic tape, and it is thus amenable to extensive manipulation and analysis. In the case of authors, we have been able to identify the frequency with which they and their papers are cited in the literature, over any chosen time period. Counts of this sort are strictly quantitative and objective. But even admitting this limitation, an author's or a paper's frequency of citation has been found to correlate well with professional standing. It is certainly not the *only* measure, nor one that can be used, for any purpose, in isolation. We do not claim for it the absolute reliability that critics of citation analysis have wrongly imputed to us when they have attacked it. The fact does remain, however, that it provides a useful objective criterion previously unavailable.

Basically the same principle can be used in evaluation of journals, rather than of authors' publications or single papers. When a scientist cites a previously published article, he tells us, in a sense, that he has read it and has some reason for bringing it to our attention. The more frequently a journal's articles are cited, the more the world's scientific community implies that it finds the journal to be a carrier of useful information.

Evaluating Journals

It has always been and still remains difficult to assess the relative importance of scientific and technical journals. There have been few, if any, totally objective criteria by which to measure them. Researchers and their library colleagues quickly learn what journals are most 'important' for particular disciplines, and countless studies have been carried out to establish 'core-journal' lists. But as research interest and activity extend beyond the basic discipline, as interdisciplinary and multidisciplinary 'mission-oriented' research requires broader journal coverage, the relevance and usefulness of journals outside the disciplinary core may be difficult to determine. Even within the small disciplinary or departmental library, when a choice between journals is dictated by restricted acquisitions budgets, considerations less relevant than scientific merit may all too likely determine or force the choice--politics, sheer habit, relative subscription cost, and so on.

Thus, the *Journal Citation Reports®* (*JCR™*) extends the use of citation analysis to examine the relationships among journals rather than among articles and their authors. The *JCR* answers these basic questions: how often has a journal been cited? what journals have cited it? how frequently have *particular* journals cited it? does the cited material in the case of a particular journal come primarily from older articles, newer articles, or does the citation pattern show a chronological consistency? what journals has the particular journal itself cited? how often has it cited each of them? is it citing old material, new material? what part of these counts is due to self-citation? In other words: who uses a particular journal? how frequently? for what purposes?

The Total Framework

Like any other tool, the *JCR* cannot be used indiscriminately. It is a source of highly valuable information, but that information must be used within a total framework proper to the decision to be made, the hypothesis to be examined, and rarely in isolation without consideration of other factors, objective and subjective. For example, there are undoubtedly highly useful journals that

are not cited frequently. Scientists read many such journals for the same reason people read newspapers and other non-scientific periodicals--to keep up with what's going on generally. They may rarely cite such journals in their published work. This does not mean that such uncited or infrequently cited journals are any less useful for their intended purpose than cited journals. It does mean, however, that these journals are written and read for a purpose other than the communication of original research findings and the indispensable summary of research findings provided by reviews.

Another consideration is that citation frequency is sometimes--indeed to some extent must be--a function of variables other than scientific merit. Some such variables may be an author's reputation, the controversiality of subject matter, a journal's circulation and its cost, reprint dissemination, its coverage by current-awareness and indexing and abstracting services, society memberships, the availability and extent of libraries' journal collections, national research priorities.

Compiling Journal Data

The *JCR*™ analyzes and summarizes a massive amount of data: the 1975 listings are based on 5,395,310 citations from the references of approximately 420,000 source items published in 1975 issues of some 2500 *SCI* source journals.

Obviously, it will be easier to use information from the *JCR* if one understands how it has been compiled. The user must remember that the *JCR* is a calendar-year report, compiled from the *Science Citation Index*® (*SCI*®) data base.

The *SCI* indicates the reference/citation links between an article published during the year and all previously published articles cited in the current article's references. The *SCI* identifies every unique link between any cited article and all articles that have cited it during the year, supplying authors' names, journal titles, journal volume and page numbers, and year of publication. The *JCR* extracts from each of these unique citation links four pieces of information: two journal titles and two publication years. One of the extracted journal titles is that in which the current citing article was published. The other journal title is that in which the cited article was published. One of the publication years is that in which the current citing article was published. Since the *JCR* is a calendar-year compilation, this year date will be the same in all cases. The other publication year will be the year in which the cited article was published.

In this extraction process many similar links are generated from the millions of different and unique links identified fully in the *SCI*. The *JCR* counts how many of these similar links there now are, and tabulates the results in its two 'detail' listings, first by citing journal and then by cited journal.

Article-to-Article Links

It is important to remember the way these counts have been generated, as described above. They are counts of reference/citation links, not counts of articles, nor of journals *per se*. For example, a 1975 article published in *Journal of the American Chemical Society* may have had 40 references. These 40 references contained, let us say, citations of only 35 *different* articles. The 35 different cited articles appeared in 10 different journals. In other words, the 40 references cited some articles--at the most 5--more than once, and cited each of the ten different journals an average of 4 times. In compiling the *JCR*, it is the number of different article-to-article links that is counted. In this case the *Journal of the American Chemical Society* is credited with 35 unique references. Their 35 citations will be distributed among the 10 different cited journals, each receiving on the average a 'cited' count of 3.5--not 4, and not 1.

Lest this point be passed over as a laboring of the obvious, the user must remain aware that the *JCR* represents only one of several possible descriptions of journal relationships. Others have been suggested above, namely, one based on data *including* duplicate citation links between the same two articles, and another based on data including only *unique journal* links rather than unique article links between the same two articles.

The Ever-Changing River of Journals

Many users will need no reminder that the management of serials, among which are included scientific journals, is one of the thorniest thickets of bibliography and librarianship. Even knowledgeable estimates of the number of extant scientific and technical periodicals vary so widely--by tens of thousands--that the uninitiated cannot be blamed for doubting the competence of those concerned with the problem.

Like a real river, the river of scientific and technical publication is ever-changing. Its elements are complex, its course confusing, but overall the difficulties and problems of serials librarianship in science are a reflection of the strength and force of its river's progress. Journals die but are replaced by others; journals grow, and split into sections (lettered or numbered or subtitled and resubtitled), or into new journals; journals may narrow their interest and merge with other journals under old or new titles; titles change to reflect a reorientation even when splitting and merging is avoided--a few words are added, some dropped, the language of the title itself may change.

This characteristic but vital inconstancy of scientific publication is severely problematic for an effort like the *JCR*™ that seeks to describe journal relationships over periods of time. There is, to be sure, the additional confusion contributed by incorrect or ambiguous citations, by the sometimes truly stultifying virtuosity of title abbreviators, by the 'separateness' of original and translated versions of the same journal, etc. As irritating and time-wasting as such things are, they are nevertheless of relatively minor significance within the total complex framework. Most are amenable to easy solution, given persistence, generous computer time, and the ability to survive seemingly endless deserts of boredom. (One very soon ceases to wonder at the reason behind some probably reasonable researcher's decision to abbreviate in yet another way the title of the *Comptes Rendus* of the French Academy of Sciences.)

When and When Not to Combine Citation Counts

The user is advised in any detailed chronological study to make use of the cross-references in the annually issued *SCI*® *Guide and Journal Lists,* and to consult periodical directories that provide historical and genealogical information about serials, such as Ulrich's or *CASSI.*

Compilation of the *JCR* has, as thoroughly as possible, dealt with these 'minor' problems. Major problems of identification remain, however, and the user and researcher must not expect that they have been solved. Any general attempt to do so would have been misguided and inevitably abortive. We have, thus, in compiling the *JCR* refrained from combining journal counts on the basis of 'lineage', even when it is clearly definable. Except where a title change has been so minor (usually among latter words) that it neither affects the title's position in a catalog listing nor requires additional or different entries, the *JCR* does not combine counts for related journals (replacements, supersedents, continuations, descendants, etc.). Nor does it combine counts for 'sections' of 'the same journal'. *JCR* leaves it to the user to decide whether or not his purpose recommends that counts be combined in such cases.

A particularly well-known example of this problem is that of Soviet journals and their translations. To alert the user, an asterisk after a main entry or subentry abbreviation signals that the journal appears in the *JCR* with counts for both original and translated versions. Unfortunately it would be impractical to attempt anything similar for the hundreds of journals that are lineally or otherwise related to others in these lists. When, for special purposes, counts have been combined, the user is informed.

Caution!

Caution is advisable in comparing journals, especially journals from different disciplines. The journal literature varies in its importance as a means of disseminating information in different fields. Wide citation may be necessary practice in one field, but because of other dissemination in others a redundancy. Citation practices differ from one field to another. The difference may be complicated by a difference in the half-life of journal literature in different fields, as well as the size of the extant citable literature. Rapid obsolescence may characterize one field but not another. Thus, for example, it would be foolish to conclude merely on the basis of citation counts that *Journal of the American Chemical Society* is a 'better' journal than *Annals of Mathematics,* or to hypothesize, without a great deal of study, which serves its own field 'better'.

Other factors must be considered as well. For example, journals that do not use the roman alphabet are not as easily and economically included in the *SCI* data base as those that do. This fact may affect the ranking and citation counts of some Russian and Japanese journals. Or a journal may have published two or three articles that are cited year after year with extraordinary frequency, compared with the 'average' article it has published. Citations of such papers may distort evaluation of the journal unless their records are taken into account.

II. Why the *Journal Citation Reports?*®

In other parts of this introduction I have tried to explain the source of the data in the *JCR*,™ to describe how the material has been summarized and displayed in its various sections, and to help the novice use it for the first time. The *JCR* answers the following types of questions immediately: how often has a particular journal been cited? what journals have cited it? how frequently have *particular* journals cited it? is it the older or new material that's being cited? what journals does this journal cite? how often does it cite each of them, etc.?

A merely curious browser, or even students or researchers, may reasonably and bluntly ask *why* these questions should be asked. What is the value of answering these questions? Can it justify a work of the *JCR*'s scope and expense? What is the *rationale* of such questions, beyond an academic itch to know? Who wants or needs the answers? Why is it necessary to compare journals or to determine their importance? Doesn't the mere fact that a journal is published say--with unarguable economic authority--all there is to be said? Aren't journals published because they are important to someone or to some group? Unfortunately life isn't that simple.

This introduction is no place to go into the complicated economics and politics of scientific and technical journal publication. The subject deserves several doctoral theses. In due course, the *JCR* will undoubtedly stimulate students to undertake them. Suffice it to say the 'authoritative' voice of economics can speak in barely more than a whisper. Indeed it can often hardly be heard from its shaky podium of subsidized and unsubsidized society sponsorship, front- and back-door government support, voluntary and mandatory and 'mandatory-voluntary' page-charge systems, advertising and public relations programs, etc. The sheer economic chaos of much of this important activity is alone good enough reason to attempt to answer questions like those posed above.

For that very reason, the *JCR* should quickly prove itself indispensable to people who cannot rely on economic criteria alone in making basic decisions about journals, since the law of supply and demand is not always allowed to prevail. These include administrators in libraries and information service centers; individual scientists; journal editors and publishers; and those who determine science policy and measure its accomplishments.

Librarians can use the *JCR* to counteract the inertia that too often prevails with regard to journal selection. It's just too difficult; therefore, *ad hoc* decisions are rampant. The *JCR* offers objective evidence of the optimum makeup of general and special journal collections. Its yearly editions will indicate or imply changes the library should consider. The chronological spread of citation counts should be invaluable in optimizing retention schedules. Why keep twenty-five years of a journal on your shelves when 80 to 90% of its cited material is less than six years old? Few libraries in the world have a mandate to collect everything and none can afford it. Most must operate within a budget on which users' journal requests can wreak havoc. Because the *JCR* gives good indication of a journal's overall use, it provides a starting point for true cost-benefit analysis in allocating acquisition funds.

Outside the library or information center's administration offices, the *JCR* can be as useful to the librarian as to the library user. At ISI® we have found the *JCR* to be the most reliable--sometimes the only reliable--indicator of a journal's subject area, and of its orientation within the subject area. One quick scan of the columns showing journals that it cites and that cite it can often be more informative than the best title or statement of a journal's editorial objectives. This capability of the *JCR* is especially useful as multidisciplinary work takes scientists to the borders of their own fields, and perhaps over them into others with less familiar journals and journals of different types. These same cited and citing lists reveal what journals in other fields are linking up with journals in their own. And, a far from trivial matter, the *JCR* can be very helpful in deciding

where to publish to reach the audience you want to reach. If, for example, you have a paper that deals with some interesting mathematical aspects of biological problems but is nevertheless definitely a *biological* paper, the *JCR*®can show you which biological journals have the best 'connections' with math, and which are most likely to welcome the paper.

Since publication of the preliminary 1969 edition of the *JCR* we have had many inquiries from journal publishers and editors. Those inquiries seem to me to speak not only for the potential of the *JCR* but also for the managerial acumen of the scientists and business people who expressed immediate interest in *JCR*. As made plain earlier, the *JCR* cannot be used alone in evaluating a journal's performance, but it *can* alone give reliable indication that a thorough evaluation--including use of the *JCR*--may be in order. Has the number of citations dropped in relation to number of articles published? Has the rate of self-citation remained steady at the expected average? How do the self-citing and self-cited rates compare? How are citations distributed among citing journals within and outside the specialty? What is the impact of the average cited article in comparison with other comparably cited journals? How rapidly--see *Immediacy Index* among the *Definitions*--is the journal's material noted in the references of other journals?

The use of the *JCR* can be of far-ranging significance in a field about which I can say least here--science--its planning, its evaluation, its sociology, its history. Citation analysis can be used to identify and map research fronts; to define disciplines and emerging specialties through journal relationships; to determine the interdisciplinary or multidisciplinary character and impact of research programs and projects. I say least about this, to me the most exciting aspect of its potential, because the *JCR* in its present form is, for such advanced applications, only a sketch of that potential, providing little more than suggestions for further and deeper examination of the massive data bank from which its sections have been extracted. I have made plain above my regret that this book has dimensional limits. Even for the generally straightforward lists of ranked and citing and cited journals, we have had to limit the data presented. For the study of science policy and sociology those limitations are more troublesome to me. I believe the *JCR* in its present form can certainly provide material for innovative research in the field. But it will serve the field best if it does, as I hope, prompt more imaginative analyses than I am competent to attempt. I shall be very disappointed if the *JCR* does not, as any good piece of scientific work should, stimulate with every answer it gives more questions that need answers.

Introduction

III. Definitions

These *Definitions* are, in some cases, actually definitions. In others, they explain usages peculiar to the *SCI*® and the *JCR*™ and their editorial conventions. In still others (e.g., *cited journal, citing journal, times cited*), the definition is meant primarily to warn the reader that, in the case of the *JCR*, there is more than initially meets the eye in these apparently obvious terms, and frequently more than the memory instantly discloses. The user will need a fair command of their meaning when reading the descriptions of the *Citing* and *Cited Journal Packages*.

Citation. When one document (B) mentions, or refers to another document (A), the latter (A) has been cited by the former (B) as a source of information, as support for a point of view, as authority for a statement of fact, etc. The word *citation* is used to indicate not only the fact that document A has been cited in a reference of document B, but also for the description of document A contained in the reference (**Lederberg J.** *J. Bact.* **63**:399, 1952). In this sense, citation and reference are frequently used interchangeably.

Citation Index. The *Citation Index* is an alphabetic list, by first author, of items cited in references from footnotes or bibliographies of a source article, Each such citation is followed by a short bibliographic description of the source article which contained the citing reference.

Cited Journal. A journal cited in a reference of an item (source item) published in an *SCI* source journal (citing journal). A cited journal is not necessarily covered by the *SCI*; that is, it may not be found in the listing of *citing journals*. Most cited journals, however, are also citing journals. *Cited journal* is used as a column heading in the *Cited Journal Package* of the *JCR*. Items in that column may include so-called 'soft' journals, and other serial publications. Such entries have been retained for their information value.

Citing Journal. A journal in which published items contained references citing another journal or published item. In the *JCR*, citing journals are necessarily *source journals* of the *SCI*.

Immediacy Index. A measure of how quickly the 'average cited article' in a particular journal is cited. A journal's immediacy index considers citations made during the year in which the cited items were published. Thus, the 1979 immediacy index of Journal X would be calculated by dividing the number of all journals' 1979 citations of items it published in 1979 by the *total number* of source items it published in 1979. It should be obvious that an article published early in the year has a better chance of being cited than one published later in the year. As a result, journals published weekly and monthly will theoretically have an advantage, as regards immediacy, over journals published quarterly and semi-annually.

Impact Factor. A measure of the frequency with which the 'average cited article' in a journal has been cited in a particular year. The *JCR* impact factor is basically a ratio between citations and citable items published. Thus, the 1979 impact factor of journal X would be calculated by dividing the number of all the *SCI* source journals' 1979 citations of articles journal X published in 1977 and 1978 by the *total number* of source items it published in 1977 and 1978. There are other ways of calculating journal impact (see **Garfield E.** Citation analysis as a tool in journal evaluation. *Science* **178**:471-79, 1972; especially note 27).

The impact factor is useful in evaluating the significance of absolute citation frequencies. It tends to discount the advantage of large journals over small ones, of frequently issued journals over less frequently issued ones (weeklies *vs.* quarterlies or annuals); of older journals over newer journals. In each such case the first is likely to produce or have produced a larger citable corpus than the second. All things being equal, the larger that corpus, the more often a

journal will be cited. The impact factor allows some qualification of quantitative data. The qualification is algorithmic and objective, but nonetheless useful in journal evaluation.

Journal Title. The title of a scientific or technical periodical, usually given in the *JCR*™ in an abbreviated form. Abbreviation of titles in the *JCR* usually ignores subtitles and title run-ons (Acta medica clinica--*an international journal of medical practice.* Zeitschrift für Neurologische Forschung *und Angewandte Gebiete*). In abbreviation of journal titles, consistency is subordinated to informativeness and clarity, as far as space allows. In alphabetic listing of journals, abbreviations are alphabetized letter by letter, with a space regarded as a 'letter' preceding *A* and a hyphen as a 'letter' following *Z*. In such alphabetic listings of 'journal titles' in the *JCR*, note that it is the *abbreviation, not the full journal title,* that is alphabetized. An *Abbreviated-to-Full Titles of Citing/Cited Journals* list begins on page 40.

Reference. The mention or description of one document (A) in another document (B), to indicate a source of information, to provide support for a point of view, to lend authority to some statement of fact, etc. Document B is said to make reference to document A; document A is said to be cited by document B. *Reference* is also used for the document description or bibliographic data given in making the reference (**Lederberg J.** *J. Bact.* **63**:399, 1952). Reference is made, that is, references are given, in footnotes, and more frequently among bibliographic end-notes or in bibliographic listings at the end of an article. From such references are extracted the *citations* which become main-entries in the *Citation Index.*

Rest. A column heading in the *Citing* and *Cited Journal Packages* of the *JCR*, used to mean 'Total Citations of Articles Published in All Previous Years'. Since the format of the *JCR* allows a chronological distribution of citation dates over a ten-year period, *Rest* means 'published prior to the decade just ended'.

Self-Citation. Self-citation of journals occurs when an article in journal X cites another article previously or simultaneously published in journal X. Self-citations are contained in about 20% of a journal's references.

Self-Citation Rate. Self-citations expressed as a percentage of all citations. There are *two* self-citation rates, the self-cit*ing* and self-cit*ed* rates. The self-citing rate relates a journal's self-citation to its total references. The self-cited rate relates a journal's self-citations to the number of times it is cited by all journals including itself. For example journal X made reference to 10000 items, including 2000 items it itself had published. Its self-cit*ing* rate is 2/10 or 20%. On the other hand, journal X was cited 15000 times in the references of all journals, including its own. Its self-cit*ed* rate is 2/15 or 13.3%.

Source Index. The *Source Index* of the *SCI*® gives a complete bibliographic description of all source items processed for the *SCI.* Items are arranged alphabetically by name of first author; all coauthors are cross-referenced to first authors. The *Source Index* is, thus, an alphabetic index by author of all items published by *SCI*-covered journals during a particular year, or during the time covered by any of the cumulations of *SCI* annuals.

Source Item. Called also source document, source article, a source item is an item published in one of the source journals processed for the *Science Citation Index*®(*SCI*). Source items may be original substantive articles, editorials, letters, technical notes, correction notes, meeting reports, reviews, etc. From the references provided by a source item, citations are extracted to prepare the *Citation Index* of the *SCI;* bibliographic descriptions of source items are prepared for the *Source Index* of the *SCI;* and words from the titles of source items are paired for production of the *Permuterm*® *Subject Index* of the *SCI.*

Some types of source items (e.g., news items, non-scientific and non-technical correspondence)

do not by their very nature invite citation in the references of scientific reports. Such source items are excluded from source-item counts in compilation of the *JCR*.™ In the *JCR* only original articles, technical notes and review articles are counted as source items, except in the case of the following journals, whose meeting abstracts are admitted as source items in impact-factor and immediacy-index calculation: *Federation Proceedings, Bulletin of the American Physical Society, Clinical Research, Transactions of the American Nuclear Society, Notices of the American Mathematical Society, and EOS--Transactions of the American Geophysical Union.*

Source Journal. A journal that is processed for the *SCI*,® so called because it is the source of published items processed for compilation of the three sections of the *SCI*. In the *JCR* a source journal is a *citing* journal.

Times Cited. The *JCR* describes relationships between journals. It is, however, based on citation links between articles. The following explanations of 'times cited' may be unnecessary for most users. Some, however, may need the information, and it is given in some detail in the interest of whatever differentiation research may require.

Times Cited: Authors. In the case of authors, 'times cited' is the sum of the citation of their cited items, as described below, including journal articles, books, etc.

Times Cited: Journals. In the case of journals, 'times cited' is based on citations of articles, as described below. It is a cumulation of the number of times a particular journal has been named in citation of different articles in references of individual source items.

Times Cited: Articles. As elsewhere in these definitions, the term *articles* is used broadly for 'journal items', and includes technical communications, letters to the editor, editorials, etc.; in other words, individual items published in journals. An article cited three times in the references of the same *SCI* source item is counted as having been cited by that source item *once*. Thus, 'times cited' in the case of articles is the cumulative number of times the article has been cited once or more by single *SCI* source items. In the case of articles, therefore, 'times cited' is equivalent to the number of source items that have cited the article.

Times Cited: Books and Other 'Non-Journal' Items. The references of journal items contain citations of many different types of publications. About 80% of the references cite other journal items. The remaining 20% cite books (single- or multi-authored monographs); edited collections of single- or multi-authored 'contributions' or 'chapters' or 'sections'; variously compiled and formatted collations of reports and papers produced by meetings, symposia, congresses; technical reports of academic, industrial, and governmental origin; personal communications; items in press; theses; 'unpublished' reports; collected works of classical and modern authors; handbooks, textbooks, data compilations; encyclopedias and other reference works; etc.

A great deal of such material presents problems for citation analysis that the journal article does not. First, styles of citation vary widely and wildly. Second, internal citation (of a single page, series of pages, section, chapter, etc.) is particularly frequent. Third, different revisions or editions, by the same author(s) or by the same or different editor(s), may be cited.

Such items cited more than once in the references of the same *SCI* source item are taken as cited as many times as there are different forms of citation. Thus, if John Smith's *Classic Chemistry* is cited three times identically as "Smith J. *Classic Chemistry*. New York: ABC Publ., 1954," it is counted as having been cited *once* by the citing article. If, however, the three references contain citations such as (1) "Smith J. *Classic Chemistry*, **1st ed.,** New York: ABC Publ., **1954, p. 25;**" (2) Smith J. *Classic Chemistry*, **1st ed.,** New York: ABC Publ., **1954, p. 86;**" and (3) "Smith J. *Classic Chemistry*. **2nd rev. ed.,** New York: ABC Publ., **1960,**" Smith's 'book' (and Smith) will be taken as having been cited three times. Thus, 'times cited' in the case of such 'non-journal' items is the cumulative sum of their single or multiple citation by individual *SCI* source items.

IV. Components of the *JCR*™

The *JCR* is made up of three data 'packages' or sections. We have retained the word 'packages' in the titles of the sections from their first publication in the form of computer printouts. The three sections are: (1) *Journal Ranking Package;* (2) *Citing Journal Package;* (3) *Cited Journal Package.*

The first section (*Journal Ranking Package*) lists cited journals alphabetically and then ranks them by five different counts or indicators.

The second section (*Citing Journal Package*) shows for each *SCI*® source journal the journals it cited in 1975, and the chronological spread of items cited.

The third section (*Cited Journal Package*) shows for each journal cited by *SCI* journals, the *SCI* source journals that cited it, and the chronological spread of items cited.

Each of these sections is described more fully in the material which follows.

The *Journal Ranking Package*

The first part of the *JCR* is the *Journal Ranking Package.* It contains six listings, described in detail on pages 10-13. The first listing is an alphabetic list of journals cited in the 1975 references of journals processed for the production of the *Science Citation Index*®. The remaining five listings rank the cited journals by various counts and indicators.

The ranking lists present a great deal of useful information. Some of it is a summing of counts of references made and citations received that are broken down by cited journal and by citing journal in the two larger parts of the *JCR.* Some of the information is presented only in these lists; for example, the number of source items published in the years 1973, 1974, and 1975 by each of the cited journals. It can be somewhat difficult initially to understand the calculation of impact factor and immediacy index, as defined in the *Definitions* elsewhere in this introduction. The summing of counts presented in the *Journal Ranking Package* gives the counts involved in the calculation of both, along with the result. Impact factor is the result of dividing the count in the fourth column of figures by the count in the seventh column. Immediacy index is the result of dividing the count in the next-to-last numerical column by the number on its left.

The fact that there are *five* ranking lists will, I hope, serve to remind users that ranking journals by any single criterion can be highly useful. But the result must be used with caution, and not in isolation without consideration of other rankings and other factors which may not be susceptible to any kind of ranking or any kind of objective, especially algorithmic comparison. Not unnecessarily, this advice of due caution is repeated elsewhere in this introduction, and in much else that the author has written on the subject. The user must remember that *rank* in the *JCR* indicates relative standing on certain lists, and that the *JCR* is, among other things, a *tool for* evaluation of journals, not itself an evaluation of journals.

Description

Section 1 is a listing of journals cited in 1974 in the references of *SCI*® source journals. The journals are arranged in alphabetic order of title abbreviation (letter by letter, with space preceding *A* and hyphen following *Z*). The first column is an item number. The second column is the journal-title abbreviation. The next four columns, bracketed under the heading '———Citations in 1974 to———' give:

(1) the total number of times the journal was cited by individual *SCI* source items in 1974;

(2) the portion of those total citations accounted for by articles the journal published in 1973;

(3) the portion of the total citations accounted for by articles the journal published in 1972; and

(4) the sum of 1972 and 1973 items cited in 1974.

The next three columns, bracketed under the heading '———Source Items in———', give

(1) the number of source items published by the journal in 1973;

(2) in 1972; and

(3) in those two years together.

The next column, headed 'Impact Factor' gives a figure for the relative frequency with which the journal's 'average cited article' has been cited. (See *Impact Factor* under *Definitions* above.) Briefly, the impact factor is the ratio of citations to citable items published: all journals' 1974 citations of 1972 and 1973 items published by journal X, divided by the total number of source items published in 1972 and 1973 by journal X.

The next two columns show, respectively, the number of times articles in the journal's 1974 issues were cited in the references of 1974 *SCI*® source items; and the number of source items the journal itself published in 1974. The last column, headed 'Immediacy Index' (see that term under *Definitions* above) is the quotient of 1974 citations divided by 1974 source items.

Thus, we see that *Acta Anaesthetica Scandinavica* was cited by all *SCI* source journals 287 times in 1974. Of those 287 citations, 62 were citations of articles published in 1972 and 1973 issues of *Acta Anaesth. Scand.* In 1973 that journal had published 54 source items; in 1972, it published 48. These 102 items (54 + 48), published by *Acta Anaesth. Scand.* in 1972 and 1973, were cited in part by *SCI* source journals 62 times in 1974, as we have seen. The impact factor is therefore 62/102, or 0.608. In 1974, *Acta Anaesth. Scand.* published 61 articles, to a few of which there were, *during 1974,* 8 references. The immediacy index is thus 8/61 or 0.131.

In some cases, a column will show a zero, a small bullet, or a blank. A zero is always a true zero; a small bullet indicates lack of data; a blank indicates an incalculable figure.

It should be remembered, as noted elsewhere, that the journals variously arranged in the sections of the *Journal Ranking Package* include not only *SCI* source journals themselves, but also other journals they have cited. In most cases, we have been able to supply the information on items published in the period 1972-1974 that is needed to fill out the entry for each cited journal not covered by the *SCI*. Where we have not, a small bullet appears.

There will, naturally, always be actual counts in the first column of these listings. A zero in the second to fourth columns of the '———Citations in 1974 to———' group is a true zero. *Abrasive Engineering,* for example, was cited only once in 1974; that citation was of an article published in some year other than 1972 or 1973, and the three columns for those two years' citations and their sum show zeros. Both impact factor and immediacy indexes are therefore also zero.

Zeros in the second group of columns headed '———Source Items In———' usually indicate that the journal is no longer published or no longer published under that title. A small bullet indicates the few cases in which we have been unable to determine the number of source items. For example, *Acta Crystallographica* was cited 7598 times in 1974. Of those citations, 40 were supposedly citations of articles published by 'Acta Crystallographica' in 1972 and 1973. As the reader may know, however, the former *Acta Crystallographica* had by 1972 split into separate A and B sections. Counts for those new journals immediately follow the entry for the former title. As shown, 'Acta Crystallographica' published nothing in 1972 and 1973, or in 1974, but incomplete citations in 1974 references of some journals failed to identify which of the A or B sections was meant. The original title is still highly cited, but cannot be given either impact factor or immediacy index. Both appear for the A and B sections in the entries below. The journal origin of the 40 incomplete citations can be partially determined by consulting the *Cited Journal Package.*

As an alert for the user, an asterisk follows the abbreviation of journals (usually Russian) which appear in the listings in both original and translated versions.

Description

In Section 1 of the *Journal Ranking Package,* cited journals are listed alphabetically by journal title abbreviation. In Sections 2-6, cited journals are rearranged in descending numerical order of counts or indicators in various columns, as follows:

Section 2. By total citations for all years
Section 3. By impact factor
Section 4. By immediacy index
Section 5. By source items published in 1974
Section 6. By number of 1972 and 1973 citations in the references of 1974 issues of *SCI*® source journals.

In Sections 2-6, the first column is a 'rank' number. In these sections, journals will have the same rank number when they show the same number or value for the count or indicator that has determined the ordering of the entries. After one or more repetitions of a rank number, the next lower rank number is advanced as many times as necessary to compensate for the repetition(s). Thus, in Section 5, B CHEM SOC JAPAN, J APPL CHEM-USSR* , and ZH PRIKL KHIM* all rank *37th* in terms of source items published in 1974. The next journal on the list, J GEOPHYS RES, ranks *40th.*

Once familiar with the *JCR*™ and its potential in journal evaluation, readers will find they want information about particular journals from several or all of the lists in Sections 2-6 of the *Journal Ranking Package.* To find the rank of a particular journal on any of the lists, look it up in the alphabetic list. Determine the count or indicator in the column by which you want the journal ranked, turn to the indicated Section of the *Journal Ranking Package,* and run down the relevant column until you find the journal's count or indicator One can of course work from any one of the Sections to any other in this manner, without beginning with the alphabetic listing in Section 1.

For example, in the alphabetic list of Section 1, *Science* is number 2325 on page 20. From that list, we find that it was cited 47,505 times in 1974. Turning to Section 2, we do not have to go far down the first numerical column to find 47,505; *Science* ranks 7th. Scanning across the row to the impact-factor column, we find a value of 5.412. Turning to Section 3, we scan barely half a page to find 5.412 and *Science,* with an impact factor rank of 48th. Jumping across to the immediacy-index column, we find a value of 1.314. Turning to Section 4, we find *Science* ranks 22nd in immediacy. It published 919 source items in 1974; turning to Section 5, we find it ranked 27th (the same as FIZ TVERD TELA and SOV PHYS SOLID ST*) in this respect. In Section 5, in the fourth numerical column, we find *Science* articles published in 1972 and 1973 were cited 11,781 times in 1974. Turning to Section 6, and starting down the fourth numerical column, we find *Science* ranking fifth.

The *Citing* and *Cited Journal Packages*

The *Citing and Cited Journal Packages* show citation-frequency relationships between pairs of journals. In the *Citing Journal Package,* one can find what journals a particular journal has cited, and a distribution by year of the publication dates of the cited material. In the *Cited Journal Package* one can find what journals have cited a particular journal, and a distribution by year of the publications dates of the cited material. Specimens with description from both appear on pages 16-19.

Relatively few journals produce most of the references processed for the *Science Citation Index* data base. Similarly, relatively few journals account for most of the citations made in those references. In either case, a list of 1000 journals will encompass well over 70% of the items. Beyond lists of 1000 journals, the 'return' in references and citations becomes progressively smaller as the lists are extended, but that return can be valuable for the information it gives about 'narrow' but important specialties and subspecialties in which journals may be few, publication infrequent, research relatively slow-paced, and so on.

Ratios like the *JCR*'s impact factor and immediacy index do much to compensate for sheer size in 'comparing' one journal in biochemistry with another, for example, or in 'comparing' a biochemistry journal to a palaeontology journal. But even with the help of such indices, we must extend the lists of citing and cited journals well beyond the select but gigantic core if we are to do justice to as many of the 'narrower' fields and subspecialties and border-marches of science as possible.

The *Citing Journal Package* includes entries for each of the 2540 journals covered by the *SCI* in 1975, provided that issues of the journal did appear during the year, or, as in the case of some 'annuals', appeared with 1975 cover dates during the early part of 1976. The *Cited Journal Package* includes entries for more than 2500 journals and other items, some of them obviously not covered by the *SCI.* As noted above, journal references contain citations of other items besides journal articles. As far as possible, citations of non-journal material have been deleted in compiling the *JCR.* Cited subentry items in the *Citing Journal Package* and main entries in the *Cited Journal Package* will, therefore, be *journals* in almost all cases. Since exclusion of non-journal material from these listings has been algorithmic, a non-journal item may appear occasionally as a cited-journal main entry, or as a citing-journal subentry.

It would have been uneconomical to give for every citing journal all the journals it cited, and for every cited journal all the journals that cited it. To do so would have made this volume many times its actual size, but would have added to it in either case mainly long strings of singly cited or citing items under every main entry. To avoid the latter, but at the same time to avoid neglect of journal relationships in 'smaller' and 'narrower' fields, the length of subentry lists has been controlled in both the *Citing Journal Package* and *Cited Journal Package.*

The following algorithm was adopted to control the length of subentry lists. Subentry lists of cited or citing journals are limited to a maximum of 100 items, or to the number of items that account for 75% of the total references or citations. Where either condition would allow listing of items cited or citing less than 6 times in the year, the items are not printed as subentries but are incorporated in the ALL OTHER subentry, the last subentry under each main entry. Disregarding these conditions, at least six subentries in addition to the ALL OTHER subentry *must* be printed, if the main entry journal can supply them.

Complete citing and cited data on all the listed journals are available on magnetic tape for users whose research requires it. Inquiries should be directed to the Research and Corporate Development Division, Institute for Scientific Information, 325 Chestnut Street, Philadelphia, Pa. 19106, USA.

Main entries in the *Citing Journal* and *Cited Journal Packages* are arranged alphabetically by journal title abbreviation. As mentioned elsewhere, consistency in abbreviation of journal title words has been subordinated to informativeness. The same word may not be abbreviated in the same way whenever it occurs. The reader can 'decode' any abbreviations that may leave him in doubt by referring to the *Abbreviated-to-Full Titles Of Citing/Cited Journals* list beginning on page 40.

Description

Citing journals are listed in alphabetical order of their abbreviated title. Thus, in the specimen shown, the entry for *Mathematische Zeitschrift* (MATH Z) comes before the entry for *Mathematika* (MATHEMATIKA). The first line of the entry for each citing journal gives its impact factor, abbreviated title (in most cases), and total number of unique references from articles the journal published in 1974. The total is asterisked. Succeeding columns of the row distribute the reference total by year in which the articles cited in the references were published. The last column includes counts for 1964 and previous years.

Thus, the specimen shows that articles published by *Mathematische Zeitschrift* in 1974 produced 1090 references with unique citations (citations of the same article in a single article's references are counted as one). Twenty-six of the 1090 references contained citations of articles published in 1974, 92 references cited articles published in 1973, 115 references cited articles published in 1972, etc. The last column in the row shows that 432 of the 1090 references contained citations of material published in 1964 and earlier years.

Under the total line for each citing journal are listed the journals cited in the references of the citing journal named in the main-entry line. These cited journals are listed, in descending numerical order, by the frequency of their citation in references of the citing journal named in the main-entry total line. The abbreviated title of each of the sub-entry cited journals is preceded by the impact factor of that journal if it has been possible to determine it. The total citation count for each sub-entry cited journal is shown, and then distributed, as described above, by year of publication of the cited items.

Thus, *Mathematische Zeitschrift* cited itself 151 times in the references of articles it published in 1974. Of those 151 citations, 5 were of articles published in 1974, 24 of articles published in 1973, 18 of articles published in 1972, etc. Thirty-six of the 151 citations were of articles published in 1964 and earlier years. Similarly, *Mathematische Zeitschrift* cited *Mathematische Annalen* (MATH ANN) 60 times in the references of articles it published in 1974. Four of these references contained citations of articles published by *Mathematische Annalen* in 1974, 2 contained citations of articles published by *Mathematische Annalen* in 1973, and so on. The chronological distribution shows that more than half (34/60) of *Mathematische Zeitschrift's* citation of *Mathematische Annalen* was of material published by *Mathematische Annalen* in 1964 and earlier years.

The last sub-entry under each citing journal main-entry summarizes data on journals that were cited less than 6 times in the references of articles published in 1974 by the journal named in the main-entry line. (Exceptions to the 'less-than-six' convention are explained elsewhere). Thus 'all other' journals cited in 1974 references of *Mathematische Zeitschrift* numbered 217, and these unnamed cited journals accounted for 356 articles. The total for 'all other' journals is distributed chronologically, as described above for named cited journals.

This specimen shows that about 40% (432/1090) of the articles cited in 1974 references of *Mathematische Zeitschrift* were published in 1964 and earlier years, that its self-citing rate is 13.8% (151/1090), that language seems to be of little hindrance in mathematical studies (there are English, French, German, Russian, Japanese journals on this cited list), that *Mathematische Zeitschrift* seems inclined to an interest in physical and applied mathematics, and that 42.6% (464/1090) of the articles it cited in 1974 were published in 1969 or thereafter.

Virchows Archiv A and **Virchows Archiv B** do not appear in the Citing Journal Package due to an error in the *JCR*™ unification dictionary. 1974 citing data is found in the 1974 *JCR* **(1975 SCI® VOL. 9)**.

Description

Cited journals are listed in alphabetical order of their abbreviated title. Thus, in the specimen above, the entry for *American Journal of Physics* (AM J PHYS) comes before the entry for *American Journal of Physical Anthropology* (AM J PHYS ANTHROPOL). The first line of the entry for each cited journal gives its impact factor, abbreviated title (in most cases), and total citations received in 1974. The total is asterisked. Succeeding columns of the row distribute the citation total by year in which the cited articles were published. The last column includes counts for 1964 and previous years.

Thus, the specimen shows that *American Journal of Physics* (*AJP*) was cited 800 times in 1974 by *SCI*® source journal items. Fourteen of the articles or other items cited in 1974 were published by *AJP* in 1974, 95 in 1973, 104 in 1972, etc. Of the 800 citations, 230 were of articles published by *AJP* in 1964 and early years.

Under the total line for each cited journal are listed the journals in whose references citations of the main-entry cited journal appeared. These citing journals are listed, in descending numerical order, by the number of citations each contributed to the citation totals for the cited journal named in the main-entry total line. The abbreviation for each of the sub-entry citing journals is preceded by the impact factor of that journal, if it has been possible to determine it. The total citation count for each sub-entry citing journal is shown, and then distributed, as described above, by year of publication of cited *AJP* items.

Thus, *American Journal of Physics* (*AJP*) cited itself 243 times in references of articles it published in 1974. Seven of those references contained citations of articles published by *AJP* in 1974; 60 of the 1974 references cited 1973 *AJP* articles, and so on. Similarly, *Journal of Chemical Physics* (J CHEM PHYS) cited *AJP* 29 times in references of articles it published in 1974. None of those 29 references cited 1974 *AJP* articles. Of the 29 references from *Journal of Chemical Physics* in 1974 that cited *AJP*, 1 cited a 1973 *AJP* article, 4 cited 1972 *AJP* articles, 2 cited 1971 *AJP* articles, etc. In eight cases, *Journal of Chemical Physics* cited articles that had been published in *AJP* in 1964 or earlier years.

The last sub-entry under each cited journal main-entry summarizes data on journals whose 1974 references included fewer than 6 citations of *AJP* in 1974. (Exceptions to the 'less-than-six' convention are explained elsewhere.) Thus, 'all other' journals whose 1974 references contained citations of *AJP* numbered 153. These 153 journals contained in all 262 citations of *AJP* articles in their references. The total for these 'all other' journals is distributed chronologically, as described for named citing journals.

This specimen shows that *AJP* has a self-cited rate of 30.4% (243/800); that 28.8% (230/800) of 1974 citations of the *AJP* were citations of older material published in 1964 and earlier years; that *Science* in 1974 cited *AJP* as often as *Solid State Communications* cited *AJP*, and interestingly enough, that *Science* cited newer *AJP* material, while *Solid State Communications* cited older material.

The specimen below opposite shows several features whose significance users will soon understand at a glance. BIOCHEM PHYSIOL VISU was cited only twice and the cited items are from the same year. The cited work is *Biochemistry and Physiology of Visual Pigments,* a symposium product published in 1973. When all citations, as in this case, are confined to the same year, the cited item is likely to be a 'soft' journal, as in this case, or as mentioned elsewhere a book of some type. Where citations are confined to two or three years, each separated by a lapse of several years, the cited items are likely to be successive reports from irregularly held symposia, conferences, etc., or successive editions of a book.

BIOCHEM SOC TRANS was cited only 502 times. The journal is *Biochemical Society Transactions,* which began publication in 1973--hence the zeros in most of the right-hand columns. The seven citations for 1972 items are the result of incorrect references. The array of zeros on the right alerts the user to the fact that the journal is relatively new. As a matter of fact, it replaces a proceedings section formerly included in *Biochemical Journal.*

BIOCHEM Z was cited 2420 times. It shows no impact factor, and practically no counts for cited items published after 1966. In fact 84% (2038/2420) of the citations refer to items published before 1965. *Biochemische Zeitschrift* ceased publication with issue number 5 of volume 346 in January 1967. It was superseded by *European Journal of Biochemistry.* The ten counts for cited items published after 1967 are the result of incorrect references.

Significant journals of science

Eugene Garfield

Institute for Scientific Information,
Philadelphia, Pennsylvania 19106.

In 1974 the Science Citation Index (SCI) *covered about 401,000 articles and communications in 2,443 scientific and technical journals. They cited about 3.2 million different publications an average of 1.8 times each. In this article some results of an analysis of more than 5 million citations in the references of journal articles indexed for the* SCI *in 1974 are presented and an attempt is made to interpret those results in the light of an earlier study of 1969 citations.*

THE basic information recorded in the *SCI* for citing and cited papers is a "condensed citation." It gives first author, year, journal, volume, and page. The citing–cited pairs can be sorted and subsorted in various ways, as one's interests dictate. Sorting by cited author produces the *Citation Index* section of the *SCI*. Sorting by citing and cited journals produces the two major sections of the *Journal Citation Reports* (*JCR*).

ISI's *Journal Citation Reports* is an index of journal–journal links based on a grouping and summation of condensed citations using journal rather than author as the primary sorting key. A preliminary *JCR*, based on an analysis of 1969 references[1], appeared in 1972[2]. This year the *JCR* became a regular section and volume of the *SCI*[3]. It is the source of the 1974 citation data discussed here.

In this report I have used two indicators of journal significance: total citations and impact. The first is simply the number of times a journal was cited in 1974. Impact, on the other hand, is a measure of the relationship between citations and articles published. For this report, impact was calculated by dividing the number of 1974 citations of 1972 and 1973 articles by the number of articles published in 1972 and 1973. For example, the 817 articles published in 1972 and 1973 in the *Journal of Molecular Biology* were cited 6,129 times in 1974. The impact of the journal is therefore 7.502.

Fig. 1(*a*) lists the 206 journals most cited in 1974. Fig. 1(*b*) lists an additional 78 journals whose 1972 and 1973 articles only—rather than articles of any and all years, as in Fig. 1(*a*)—were highly cited in 1974. (The total of 284 journals in Fig. 1(*a*) and (*b*) corresponds to the number of journals listed in Fig. 2(*a*) and (*b*), which have impacts greater than 2.) In most cases (63%) these journals began publication in the 1960s and 70s. Older journals like the *Comptes Rendus* rank well in Fig. 1(*a*), mainly because there is so much that can be cited. Fig. 1(*b*) is a needed supplement to the list in Fig. 1(*a*), since the journals have high current citation but lack historical mass to push them up into the top of a list ranked by total citations.

Figures 2(*a*) and (*b*) show the 284 journals with impacts greater than 2. Fig. 2(*a*) lists 206 primary journals. Fig. 2(*b*) lists 78 review journals; the impact of review journals is generally higher than that of primary journals.

Figure 3 lists journals that rank highest in citation and impact for three specialities: mathematics, botany, and astronomy/astrophysics. The differences in average impact and citation between the three illustrative categories indicate why comparisons between journals in different specialities may be invidious. For example, it would be foolish to conclude merely on the basis of citation counts that *Astrophysical Journal* is a "better" journal than *Annals of Mathematics*, or to hypothesise without a great deal of study which serves its own field "better."

Variation from field to field is determined by the interplay of several factors. Perhaps the most important is the average number of references per paper in the field[4]. In general, mathematicians cite less than half as many papers as do biochemists. Engineers on the other hand cite books as heavily as journals, as do social scientists. Furthermore, calculation of impact based on 1972 and 1973 publications is bound to affect the impact of journals in a field like mathematics, where citation of older literature is far more common than in others. Thus, the impact of mathematics journals would be higher if calculated on the basis of 1970 and 1971 publications.

It seems necessary to point out the obvious, as I have done in preparing Fig. 3, because one short-sighted criticism of the *JCR* has been that its listings and rankings are undiscriminating. One can get from the *JCR* information on journals within disciplines for intradisciplinary comparison. None of the mathematics journals listed in Fig. 3 was cited enough to appear in Fig. 1(*a*), but the citation counts and impact factors show plainly that the two leading mathematics journals are *Transactions of the American Mathematical Society* (on the basis of total citations) and *Acta Mathematica* (on the basis of impact). In both citation and impact the average mathematics journal ranks lower than the average astronomy or botany journal.

If one wishes to add to a general-science collection the two or three leading journals of mathematics, botany, or astronomy/astrophysics, one must examine longer lists and select from them the top journals in each speciality, as I have done in preparing Fig. 3.

The remarkable stability of the significant journals of science is attested by their continued high citation and impact. Of the 206 journals most cited in 1969, 169 remain among the top 206 in 1974. One may regard the changes as the result of healthy competition. The 37 journals that dropped from the 206 most cited between 1969 and 1974 rank between 224 and 426 in the complete listing that appears in the *JCR*[5].

Fig. 1*a*, Journals most highly cited in 1974. Journals are listed in descending numerical order of total citations in the references of 1974 issues of journals processed for the *Science Citation Index*. A: rank in terms of total 1974 citations. B: rank in terms of total 1969 citations. C: total 1974 citations. D: 1974 impact. E: total 1974 citations of 1972 and 1973 articles. F: rank in terms of 1974 citations of 1972 and 1973 articles. An asterisk before a journal title indicates that counts for sections, retitled continuations, translated versions, and so on, have been combined with those for the original; the number in parentheses after the journal title indicates the number of such sections, and so on, that went into the combination, including the original. *b*, Journals whose 1972 and 1973 articles were highly cited in 1974. Journals are listed in descending numerical order of total 1974 citations of their 1972 and 1973 articles. Journals ranking higher in this respect will be found among the journals listed in Fig. 1*a*. See the legend of Fig. 1*a* for significance of the column markers. An asterisk before a journal title indicates that counts for sections, retitled continuations, translated versions, etc., have been combined with those for the original; the number in parentheses after the journal title indicates the number of such sections, etc., that went into the combination, including the original. The date of a journal's inauguration follows its title.

Perhaps the point to be stressed in presenting these data is the bibliographic law of concentration[6]. When the *SCI* was first reviewed in *Nature* more than a decade ago[7], the scope of its journal coverage was called into question. I believe time has shown beyond doubt that the important literature of science is encompassed by fewer than 1,000 journals. And even fewer account for the truly significant. Of some 45,000 serials of all kinds received by the British Lending Library, two-thirds are rarely, if ever, subject of request. A small core of about 5,000 accounts for almost 80% of all requests[8].

Fig. 2 *a*, High-impact journals in 1974 (excluding review journals). Journals are listed in descending numerical order of 1974 impact factor. *b*, High-impact review journals. A: rank in terms of 1974 impact; B: 1974 impact; C: 1969 impact; D: total 1974 citations of 1972 and 1973 articles; E: total number of 1972 and 1973 articles.

In using the data presented here, one should be aware that we revised our definition of "source items" used to calculate impacts. In 1969 we included as source items much material (editorials, non-scientific and non-technical correspondence, news notes, and so on) that does not by its very nature invite citation in scientific and technical reports. This policy worked to the disadvantage of some major journals. Our redefinition accounts in part for the changed impact in 1974 of journals like *Nature, Science, Lancet, Journal of the American Medical Association,* and *British Medical Journal.*

What is the significance of journal impact? By demonstrating that only 150 journals have impacts greater than 3, I believe we have established the futility of discussions based on the assumption that the average library must acquire and store thousands of journals. Since the average impact in 1974 was 1.015, any of the journals listed in the figures is likely to be a good candidate for selection.

Fig. 2(*b*) shows clearly the importance of review journals, confirming our earlier studies. Their extraordinary impact, along with a surge in the number of review-type articles and publications, led to ISI's decision to publish *Index to Scientific Reviews*[9].

Clearly, a large part of the scientific record is of low impact. Only careful study can show whether this fact

Fig. 3 Significant journals in three scientific specialities. Each list gives journal, (A) total 1974 citations, (B) impact factor, (C) total 1974 citations of 1974 articles, (D) number of 1974 articles. Journals are listed in alphabetical order. The botany journals include all with more than 600 citations or an impact greater than 1. The astronomy/astrophysics journals include all with more than 400 citations or an impact greater than 0.8. The mathematics journals include all with more than 500 citations or an impact greater than 0.5.

supports or contradicts the idea that science is built on the accumulated results of average effort that prepare the way for breakthroughs[10]. In any event, the data seem to me to warrant an examination of the cost-effectiveness of the present publishing system. Journals devote to the mass of rarely cited papers the same resources as to the small part that citation analysis shows to be important. Less than 1% of all papers cited will be cited ten or more times in any annual *SCI*. Although more than 40 million references have been processed for the *SCI* during the past fifteen years, only 116,400 papers have been cited ten times or more in any one year.

One would hope that the availability of *Journal Citation Reports* will have a salutary effect on editorial complacency. A change in a journal's citation rate or impact rate is proper reason for editorial concern, admitting that factors beyond editorial control may be responsible. Thus, a drop in the impact of the leading Soviet journal of physics, *Zhurnal Eksperimentalnoi i Teoreticheskoi Fiziki*, or a rise in the impact of *Teploenergetika* (translated as *Thermal Engineering*) may reflect a shift in interest or emphasis of research worldwide. But a change in citation rate or impact rate may just as likely reflect a change in quality of output.

Journal citation analysis can be quite complex in some cases. The problem of Soviet publications is one such case. Apart from the usual bibliographic problems encountered, one must deal with the fact that most leading Soviet journals appear in two versions, Russian and English. *Fizika i Tekhnika Poluprovodnikov* appears in English as *Soviet Physics Semiconductors*. Clearly that is not a close translation of the title, much less a transliteration. Such bibliographic casualness about titles is bad enough, but there is worse. Most of the retitled translations appear about a year after the originals. This means, if one assumes that the translation is the major stimulant of subsequent citation in Western journals, that the citable life of the Soviet literature is unfairly shortened at the outset by an overlong gestation period. And the outset is important, for if an article is going to be cited, it is most likely to be cited during the first or second year after publication. In the case of Russian journals, citations contributed by translated versions are usually out of phase with those of the rest of the literature. To assure confusion worse confounded, some of the translated versions have volume and page numbers different from the Russian originals. In our tabulations for the *JCR*, we have as far as possible compensated for these annoying vagaries.

As the data show, new journals can achieve high impact quickly. Good examples are *Cellular Immunology* (first published 1970) and *Prostaglandins* (1972). Their total 1974 citation counts were 2,809 and 1,470 respectively; their impacts, 4.848 and 5.247. Among the newer journals the 'European' journals are especially notable in this respect. *FEBS Letters* (began 1968, impact 3.049); *European Journal of Biochemistry* (began 1967, impact 3.874); *European Journal of Immunology* (began 1971, impact 4.852). We must hope that internationalisation of journals will continue. I believe that Latin-American, Asian, and African

journals would do well to consolidate in like manner to produce fewer but larger journals. It is clear that a large journal, even if less than first class, is more difficult to ignore than a smaller journal with equal and perhaps greater impact.

In some cases, however, consolidation is inappropriate and may be detrimental. Take, for example, *Journal of the American Chemical Society* (*JACS*) and *Journal of the Chemical Society*. The *Journal of the Chemical Society* encompasses nine different subtitled journals. If one were to consolidate comparable journals of the American Chemical Society, their total citation count would be about 183,000, almost double the 98,995 of the *JACS*. The impact of this conglomerate would, however, be only 3.381 (respectable enough) rather than 4.383. Insistence by the Chemical Society upon corporate identity for its journals by means of an identical "main title" with repeatedly retitled sections is the source of bibliographic confusion, as well as of much tedious work in sorting out citation data. It seems to me that most commercial publishers would have refused to scrap a title as well-known as *Transactions of the Faraday Society*. In my opinion, the umbrella of a corporate main title for all a society's journals does little for their individual identities.

I have avoided commentary on the performance of specific journals, preferring to use the space granted me here for data rather than comment and speculation. And I have published many such analyses, usually on a categorical basis in *Current Contents*. All of them have had the same purpose, and lead to the same general conclusion. Science needs objective criteria for measuring the performance of journals. Citation analysis seems to offer a sound beginning. Considering the paucity of management tools available to the average science librarian—general or specialist—and considering as well the often prejudicial role of individual scientists in journal selection (we all have our favourite journals), I feel that the *JCR* data can provide a more reliable basis for journal selection than any we have had until now.

SCIENCE

Citation Analysis as a Tool in Journal Evaluation

Journals can be ranked by frequency and impact of citations for science policy studies.

Eugene Garfield

As a communications system, the network of journals that play a paramount role in the exchange of scientific and technical information is little understood. Periodically since 1927, when Gross and Gross published their study (*1*) of references in 1 year's issues of the *Journal of the American Chemical Society*, pieces of the network have been illuminated by the work of Bradford (*2*), Allen (*3*), Gross and Woodford (*4*), Hooker (*5*), Henkle (*6*), Fussler (*7*), Brown (*8*), and others (*9*). Nevertheless, there is still no map of the journal network as a whole. To date, studies of the network and of the interrelation of its components have been limited in the number of journals, the areas of scientific study, and the periods of time their authors were able to consider. Such shortcomings have not been due to any lack of purpose, insight, or energy on the part of investigators, but to the practical difficulty of compiling and manipulating manually the enormous amount of necessary data.

A solution to this problem of data is available in the data base used to produce the *Science Citation Index* (SCI) (*10*). The coverage of the SCI is international and multidisciplinary; it has grown from 600 journals in 1964 to 2400 journals in 1972, and now includes the world's most important scientific and technical journals in most disciplines. The SCI is published quarterly and is cumulated annually and quinquennially, but the data base from which the volumes are compiled is maintained on magnetic tape and is updated weekly. At the end of 1971, this data base contained more than 27 million references to about 10 million different published items. These references appeared over the past decade in the footnotes and bibliographies of more than 2 million journal articles, communications, letters, and so on. The data base is, thus, not only multidisciplinary, it covers a substantial period of time and, being in machine-readable form, is amenable to extensive manipulation by computer.

In 1971, the Institute for Scientific Information (ISI) decided to undertake a systematic analysis of journal citation patterns across the whole of science and technology. It began by extracting from the data base all references published during the last quarter of 1969 in the 2200 journals then covered by the SCI. The resultant sample was about 1 million citations of journals, books, reports, theses, and so forth. To test whether this 3-month sample was representative of the year as a whole, it was matched against another sample made by selecting every 27th reference from the approximately 4 million references collected over the entire year. The two samples were similar enough in scope (number of different items cited) and detail (relative frequency of their citation by different journals) to convince us that the 3-month data constitute a valid sample.

With this data from the last quarter of 1969, ISI produced three listings that should greatly further efforts to map the network of journal information transfer. The first listing is a cumulation of all citations of the same titles. It gives the number of times each different title was cited during the last quarter of 1969 and distributes that total over the years in which cited issues, editions, and so on were published. This distribution is shown by year from 1969 back to 1960 and in aggregate form for earlier years (*11*). Sample items from this listing are shown in Fig. 1.

The second listing is a detailed citation history of each cited title. It shows how frequently each title was cited and, as above, gives subtotals by year of publication. These citation totals and subtotals are further broken down to show how frequently each journal covered by SCI cited the title in question and the distribution by year of publication of cited items. A portion of this listing is shown in Fig. 2.

The third listing is similar to the second, but it arranges the data by citing journal rather than by cited title. The listing shows, for each journal covered by the SCI, the number of references published in issues processed for the SCI during the last quarter of 1969, and it breaks that total down by publication date of the items to which reference was made. The listing further identifies all titles cited in those references and the frequency with which they are cited. As in Fig. 2, the counts for each cited title are broken down by year of publication. A portion of this listing is shown in Fig. 3.

These listings afford, I believe, a new view of the literature in scientific and technical journals. Before discussing some of its implications, however, I note possible limitations of the data and problems encountered in analyzing the sample.

The SCI data base is, to my knowledge, the largest and most extensive of its kind. It does not, however, cover every scientific and technical journal. (Nor, as seems likely in view of findings discussed later in this article, need it attempt to.) The list of most frequently cited journals (the first 152 of these journals are given in Fig. 4) shows that the SCI has been remarkably successful in covering all "significant" and "important" journals, insofar as citation counts can be considered a reliable measure of "importance" and "significance." It is, of course, possible that one or more journals not covered by the SCI, and thus not represented in the data here, may cite themselves and other journals so frequently that their inclusion would alter their own and other journals' rankings. Such may be the case, for example, with certain journals

Fig. 1. Journal citation frequencies. The data show the total number of times each journal was cited during the last quarter of 1969 and the distribution by publication date of the particular issues cited. The journals shown were taken from a list of more than 20,000 items (journals, books, reports, theses, and so on) cited during the last quarter of 1969 in journals covered by the SCI.

in foreign languages, particularly those that do not use the Roman alphabet. As is true of most secondary services, the SCI is less likely to cover a journal that presents problems of transliteration (or transcription) and translation than one that does not. It may be, therefore, that this fact has adversely influenced the ranking of Russian and Japanese journals, for example, which probably cite other Russian and Japanese journals more frequently than do journals in other languages. Whether such an underrepresentation exists, and, if so, to what extent, is difficult to determine. Nevertheless, Soviet information scientists have reported that the SCI does a surprisingly good job of covering Soviet journals. In fact, Soviet scientists seem to have made more use of citation analysis in studies of science policy than have any other scientists (*12–14*).

One must remember that the listings were prepared from a 3-month sample of journal issues. The size of the sample is certainly more than adequate for statistical purposes, and, as noted, the sample has been matched against another sample of more than adequate size. It is nevertheless possible that random events in journal publishing have introduced some degree of distortion. For example, a journal may have, in the time period covered by the sample, departed from its usual policy of accepting only original research communications and published one or two review articles with extensive bibliographies. In the sample, that journal would appear to cite other publications more widely and more frequently than it actually does on the average. Or, a journal may have published an article that has since been cited with extraordinary frequency (*15*). In such a case, a single article will have had an inordinate influence on the ranking of the journal (*16*). Finally, a journal that publishes relatively few articles, but articles of high quality that both cite and are cited frequently, may seem to have considerably less impact than it actually does, particularly if the journal appears infrequently or irregularly and thus escapes representative inclusion in a sample of this type.

Fig. 2. Statistics on cited journals. The data on cited journals show the total number of times each journal was cited in the last quarter of 1969 and the distribution by publication date of cited issues. For each cited journal, the figure identifies all other journals ("citing journals") that referred to it five times or more during the quarter year (and the distribution of these citations by publication date of cited issues). Journals that referred to the cited journal less than five times are grouped as "all other." The data were taken from a complete list of journals cited during the last quarter of 1969 in journals covered by the SCI.

In analysis of the sample, an immensely irksome problem was the inconsistency with which different authors and editors abbreviate journal titles in their references. As far as possible, this inconsistency has been minimized by standardizing all variants of the same titles and their abbreviations. Some idea of the work involved in this standardization can be had from the fact that there were more than 100,000 different abbreviations for the 12,000 individual journal titles cited in the 3-month sample (*17*). Inconsistency was made worse by inaccuracy. In some cases, it was possible to disentangle the results of bibliographic carelessness—as, for example, when *Sol. St. Phys.* proved to have been used indiscriminately to identify *Solid State Physics* (Academic Press); *Solid State Physics, Proceedings of the Physical Society, London; Soviet Physics Solid State* (a cover-to-cover translation of *Fizika Tverdogo Tela*); and even *Physica Status Solidi* (Akademie-Verlag). In other cases, however, it was impossible, without going to inordinate expense, to determine exactly which journal was being cited—for example, when *Ann. Phys.* was found to have been used for *Annalen der Physik, Annals of Physics*, and *Annales de Physique*. It is not surprising that the editors of at least one publishing house, having decided that the problem of unique and unambiguous journal title abbreviations is simply insoluble, now use full titles in every reference to a journal.

Finally, it was necessary to make some arbitrary decisions in order to avoid unduly complex bibliographical technicalities. Journals merge; they split into new journals, or into "sections" that may be published separately or together. They change titles, with or without continuing their numbering of volumes and issues. Some journals appear in one or more translations; some such translations are complete, others selective, and some are similarly, others differently, numbered. Supplements outside a regularly enumerated series must be accounted for. In a few cases, journals periodically change their titles on single issues to note special subject matter (*18*). Serials librarianship abounds in difficulties of this type, and there is frequently disagreement on how best to handle them. Briefly: a journal published in sections is considered a single journal; translations of journals are identified with the original versions; changes of title have been ignored and previous volumes attributed to the current title; journals absorbed or incorporated by other journals have been credited to a new or remaining title; supplements have been considered as issues in the regular series. For the purposes of this analysis, such arbitrary decisions seem justified; as required in the future, the raw citation data can, of course, be compiled and manipulated in such a way as to differentiate between changed titles, sections, translations, and so forth.

Some Preliminary Analyses

Figure 4 shows the result of a familiar application of citation analysis. It is a listing of journal titles ranked by the frequency with which they were cited in the references of journals indexed for SCI. This partial listing gives the top 152 of the 565 most frequently cited journals of science and technology. (The top 152 account for 50 percent of all references to journals.)

It is apparent, even from the makeup of this partial listing, that a good multidisciplinary journal collection need contain no more than a few hundred titles. That is not to say that larger collections cannot be justified, but it does say something indisputable, in terms of cost and benefit, about how large a journal collection need be (or how small it can be) if it is to provide effective coverage of the literature most used by research scientists.

It is also immediately apparent that the majority of all references cite relatively few journals. Figure 5, which plots the distribution of citations among cited journals, shows that only 25 journals (little more than 1 percent of SCI coverage) are cited in 24 percent of all references; that only 152 journals (those listed in Fig. 4) are cited in 50 percent of all references; that only 767 journals are cited in 75 percent of all references; and that only 2000 or so journals are cited in 85 percent of all references. In addition, the data from which Fig. 5 was plotted show that only 540 journals are cited 1000 or more times a year, and that only 968 journals are cited even 400 times a year. When one considers that only 165 or so journals publish 400 or more papers a year, the impact of the average paper must be recognized as relatively slight. In fact, the average paper is cited only 1.7 times a year (*19*).

This analysis gives good reason for concern about any increase in the number of scientific and technical journals. It is not merely that increased numbers of journals make coverage of the literature more difficult, but that so many journals now being published seem to play only a marginal role, if any, in the effective transfer of scientific information. If one accepts the contention (highly debatable, in my opinion) that there are between 50,000 and 100,000 scientific and technical "journals," the data presented here indicate that only 5 to 6 percent of them are being cited. If such percentages seem unrealistically low, it may be because the estimate of 50,000 to 100,000 scientific and technical journals (requiring indexing and abstracting for "total coverage" of the literature) is itself as unrealistic as information scientists have for some time suspected it must be (*20*). Meaningful discussion of this point—the best of current serials catalogs notwithstanding—is probably impossible in the absence of agreement on what, quantitatively as well as qualitatively, constitutes a "scientific journal." At the very least, it may be advisable to distinguish as journals only those periodicals that publish, for example, 20 or more articles a year.

The predominance of a small group of journals in the citation network has been confirmed by a weekly scanning of SCI input to a system for selective dissemination of information (SDI) (*21*). In this SDI system, a newly published article can be retrieved on the basis of journals cited in the article's bibliography or footnotes. This retrieval criterion is known in an SDI profile as a "cited-journal question." A retrieval profile consisting of only 25 different cited-journal questions will retrieve 50 percent of all articles processed for the SCI every week. In other words, half of all articles published cite at least one of the 25 most frequently cited journals at least once.

It is also interesting that a small group of journals is found to be predominant when the literature is analyzed in other ways. Figure 6, for ex-

Fig. 4. The 152 most frequently cited journals ranked by frequency of citation in journals covered by the SCI. Column 1 gives rank, and column 2 gives abbreviations of the titles of cited journals. Column 3 shows the total number of times each journal was cited during the last quarter of 1969. Column 4 gives an estimate of the total number of citations in 1969 of items published in 1967 and 1968 (the estimate was made by quadrupling the 1969 citations of 1967 and 1968 items in the 3-month sample). Column 5 shows the total number of items processed from each journal by the SCI during 1967 and 1968. Column 6 indicates the impact factor (average citations per published item) derived by dividing the numbers in column 4 by those in column 5.

(The reader may be interested in comparing the order of journals in this figure with that in the list for 1974 on page 20 of this volume.)

ample, plots numbers of articles published against numbers of journals. It shows that, of the 2200 journals covered by the SCI in 1969, about 500 published about 70 percent of all articles published. As shown in Fig. 7, a small group of 250 journals provided almost half of the 3.85 million references processed for the SCI in 1969. The predominance of cores of journals is ubiquitous. An analysis of what journals first published reports of newly synthesized compounds indexed for *Current Abstracts of Chemistry and Index Chemicus* gives a similar result: of the 183 journals indexed by this publication in 1969, 11 percent of the journals accounted for 60 percent of the new compounds, 22 percent of the journals for 79 percent of the compounds, 32 percent of the journals for 89 percent of the compounds, and so on (*22*). *Chemical Abstracts* presents an even more striking example of this predominance: about 8 percent of the journals it covers publish more than 75 percent of the items it abstracts (*23*).

The data reported here demonstrate the predominance of a small group of journals in the citation network. Indeed, the evidence seems so conclusive that I can with confidence generalize Bradford's bibliographical law concerning the concentration and dispersion of the literature of individual disciplines and specialties (*2*). Going beyond Bradford's studies, I can say that a combination of the literature of individual disciplines and specialties produces a multidisciplinary core for all of science comprising no more than 1000 journals. The essential multidisciplinary core could, indeed, be made up of as few as 500 journals if, for example, one is attempting to satisfy the needs of libraries in developing countries.

Other Considerations

Citation frequency reflects a journal's value and the use made of it, but there are undoubtedly highly useful journals that are not cited frequently. Scientists read some journals for the same reason people read newspapers—to keep up with what's going on generally—and they may rarely or never cite such journals in their published work (*24*). A popular review journal such as *Scientific American* or a news-oriented journal such as *New Scientist* may rank relatively low on a times-cited list (in

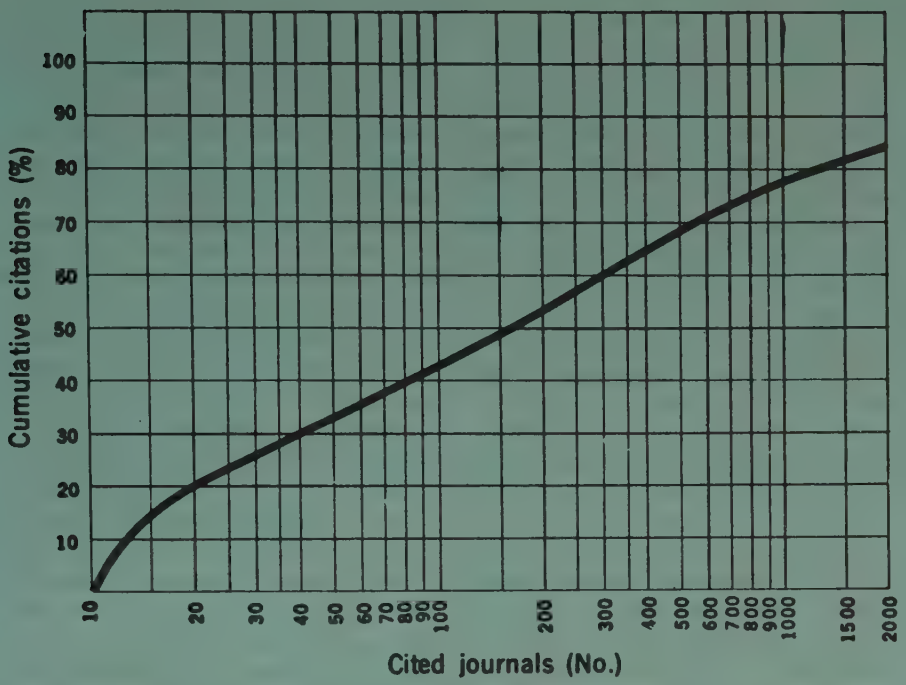

Fig. 5. Distribution of citations among cited journals. The curve shows that a relatively small core of 152 journals accounts for about half of all citations and that only 2000 or so journals account for about 84 percent of all citations.

fact, *Scientific American* is 449th, while *New Scientist* ranks well below 1000), but that does not mean that they are therefore less important or less widely used than journals that are cited more frequently. It merely means that they are written and read primarily for some purpose other than the communication of original research findings.

Citation frequency is, of course, a function of many variables besides scientific merit. Some of them are known or can reasonably be assumed: an author's reputation, controversiality of subject matter, circulation, availability and extent of library holdings, reprint dissemination, coverage by secondary services, priority in allocation of research funds, and others. It is extremely difficult, even when possible, to clarify the relations among such variables and their relative impact on citation frequency. One such variable is, however, fairly obvious. If every article has an equal likelihood of being cited, it should follow that the more articles a journal publishes, the more frequently the journal will be cited. For the most part, the data show that such is indeed the case. Although many articles are never cited (*25, 26*), I have very rarely found among the 1000 most frequently cited journals one that is not also among the 1000 journals that are most productive in terms of articles published. Citation frequency of a journal is thus a function not only of the scientific significance of the material it publishes (as reflected by citation), but also of the amount of material it publishes.

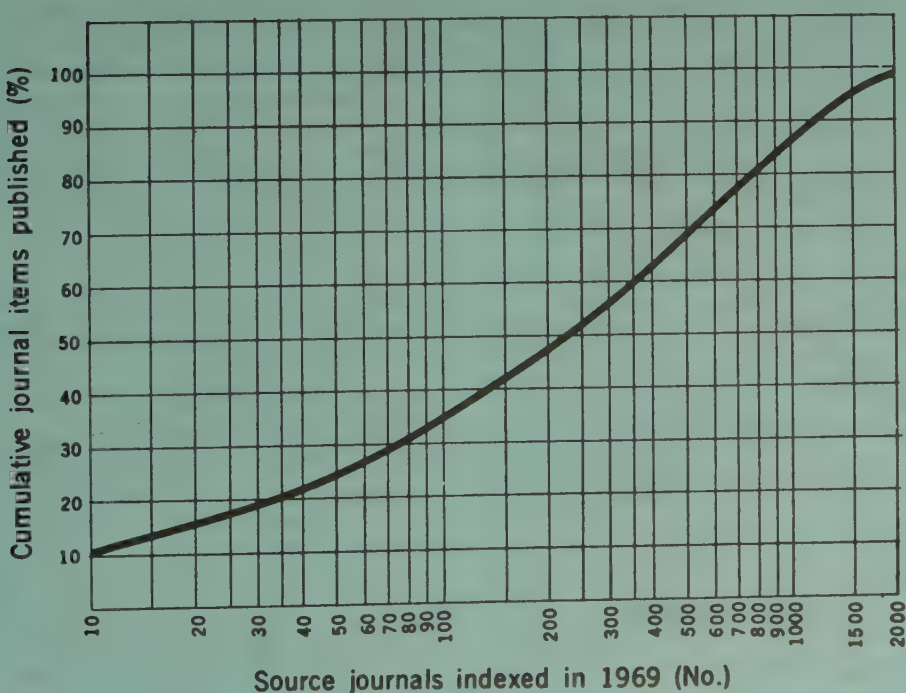

Fig. 6. Distribution of the number of published items among the approximately 2200 journals covered by the SCI in 1969. The curve shows that a relatively small core of journals carried the majority of items published.

In view of the relation between size and citation frequency, it would seem desirable to discount the effect of size when using citation data to assess a journal's importance. We have attempted to do this by calculating a relative impact factor—that is, by dividing the number of times a journal has been cited by the number of articles it has published during some specific period of time. The journal impact factor will thus reflect an average citation rate per published article (*27*). However, the development of impact factors that fairly relate the size of a journal during the cited years to its current citation rate is a formidable challenge to statistical analysis. With the SCI data base, it is easy to determine how frequently a journal has been cited within a given period of time, but it is much more difficult to agree on a total-items-published base to which such citation counts can properly be related because the items may have been published at any point in the journal's history. In selecting an items-published base (*28*) for each journal, I have been guided by the chronological distribution of cited items in each annual edition of the SCI (*19*, p. 15; *29*). An analysis of this distribution has shown that the typical cited article is most heavily cited during the 2 years after its year of publication. (In any given year, 21 to 25 percent of all references cite articles that are 3 or fewer years old.) Therefore, since my sample consists of references made in 1969, I have taken as the items-published base for each journal the number of items it published during 1967 and 1968. To calculate an impact factor for each journal, I divided the number of times 1967 and

1968 articles were cited in 1969 by the number of articles published in 1967 and 1968. Martyn and Gilchrist used a similar method in ranking British journals in an analysis of 1965 SCI data (*30*).

Figure 8 shows the top 152 of the 565 most frequently cited journals ranked by impact factor. Many of the 152 journals do not appear on this high-impact list; in fact, only 75 journals are common to both lists. It will be interesting to observe further changes in the ranking of the most frequently cited journals as calculations of impact factor are extended to 1000 journals and eventually to the approximately 2400 journals now covered by the SCI.

Some Applications

The results of this type of citation analysis would appear to be of great potential value in the management of library journal collections. Measures of citation frequency and impact factor should be helpful in determining the optimum makeup of both special and general collections. Analysis of the chronological distribution of items cited can serve as a guide in determining the optimum size of back files, and, since the data give a detailed view of each journal's citation history, binding and retention schedules can be rationally established journal by journal, rather than for groups of journals (*31*). Another application, which harried librarians may welcome, is the correlation of data on citation frequency and impact with subscription costs. Such a correlation can provide a solid basis for cost-benefit analysis in the management of subscription budgets.

Individual scientists also face the problem of selecting journals to read and keep, as well as compiling reference and reading lists for themselves and their students. Although each of the relatively few journals that are very useful in a given discipline or specialty may be well known, it can be difficult to gauge the merits of the other journals in that discipline or specialty and to decide what journals to get and how long to keep them. It should be noted, in this connection, that analyses of citation frequency and impact factor can be tailored to the specific interests and requirements of individuals by restricting the number of citing journals to a small group of familiar titles. Thus, with a list of the ten or so most frequently cited chemical journals (or merely ten journals favored by a particular chemist), one can, by constructing lists of citation frequency and impact factor, gradually augment the small group and the citation data base with journals of demonstrable relevance. I am using this technique to establish a list of journals for the projected *Social Sciences Citation Index*.

Editors and editorial boards of scientific and technical journals may also find citation analysis helpful. As it is, those who formulate editorial policies have few objective and timely measures of their success. A wrong policy, or a policy wrongly implemented, may have serious effects on revenue and prestige, and the work of regaining readers and reputation can be difficult and expensive. Editors can find useful indicators of a journal's performance in the extent of self-citation, the number of times cited per year, and the distribution of citations among citing journals within and outside the specialty literature.

Perhaps the most important application of citation analysis is in studies of science policy and research evaluation. Price has shown how citation data can be used to identify research fronts (*25*). Soviet information scientists are using citation data to evaluate the implementation of science policy in the U.S.S.R. (*12, 14, 32*), and the sociological studies of Hagstrom and others (*33*) give convincing evidence of the utility of this approach.

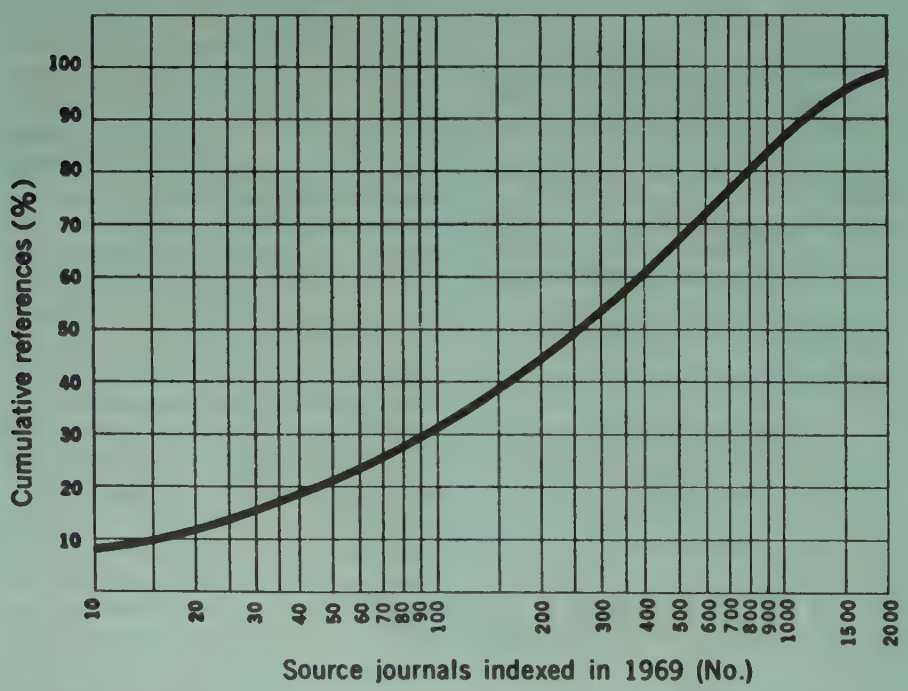

Fig. 7. Distribution of references among journals covered by the SCI in 1969. The curve shows that fewer than 300 journals provided more than half of the references processed.

Unanswered Questions

The data reported here suggest many avenues for further study. What, for example, is the significance of an abnormally high self-citation rate? Is it characteristic of parochialism, eccentricity, mediocrity? Does it indicate that a particular field of study has as yet no basis for interaction with other fields? Which is true in a particular case and how does one go about finding out?

What is the significance of a wide, multidisciplinary spread of titles cited in the references of a given journal or group of journals? Is it a measure of multidisciplinary activity? If so, is it a valid enough measure to warrant applying the Weinberg criterion (*34*) of multidisciplinary impact in order to determine the amount of government support merited by particular areas of research? Does the fact that *Ecology*, for example, cites more than 500 different journals in a total of 1000 references make it more multidisciplinary than the *Journal of the American Chemical Society*, which cites only twice as many journals in ten times the number of references, or than *Physical Review*, which cites only 600 or so journals in 15,000 references? Does the nonlinearity of publication and citation distributions among citing and cited journals confirm beyond doubt only that relatively few journals are primary nodes

Fig. 8. The 152 most frequently cited journals ranked by impact factor (average number of citations per item published). The column headings are explained in the legend of Fig. 4.

in the communications network, or does it have some other significance?

And what is the significance of a wide disparity between the number of journals cited by a given journal and the number that cite it? *Ecology* cites 500 or so journals but, in turn, is cited by only 115. What does this say, other than the obvious, about ecology and *Ecology*? Is the applicability of work done in ecology and being reported in *Ecology* much narrower than the interests of ecologists?

Several investigators of problems in science policy and science management are already using the SCI data base to explore such questions and many others. Each is trying, for different reasons, to build a model of the journal communication network that will provide more functional definitions of disciplines and specialties, that will make it possible to define in detail how different fields of knowledge interact, that will provide methods of predicting interdisciplinary impact, and that will perhaps provide more effective ways of monitoring research performance. Using the SCI data base to map the journal communications network may contribute to more efficient science.

Randall, Protein measurement with the folin phenol reagent. *J. Biol. Chem.* **193**, 265 (1951). That article represents only 0.7% of the *JBC*'s average quarterly output, but it accounts for 5% of all citations of the *JBC* in our quarter-year sample. Lowry's article is not as atypical of articles from *JBC* as it is atypical of all articles. Of the 50 articles most cited in 1967, 13 (26%) had appeared in *JBC*.

27. The impact factor discussed in this article (average citation rate per published item) gives some idea of the frequency with which the "average" paper in a particular journal is cited. The factor is, of course, adversely affected by papers in the journal which are not cited at all, and, as noted above, favorably affected by papers cited with unusual frequency. The influence of uncited and very frequently cited papers can be discounted by considering the total number of citations in relation to cited items only (rather than in relation to all published items), or by considering only number of cited items (rather than total citations) in relation to all published items. For example, if the items-published base is 100 articles and one article has been cited 50 times while 99 articles have not been cited at all, the impact factor would be 0.50. The same impact factor of 0.50 could be derived for the journal that had half of its 100 articles cited only once and the other half not cited at all. If one considers only cited items, a per-cited-item impact factor can be derived to distinguish between the two journals. In the first case, the per-cited-item impact factor would be 50.0; in the second, 1.0. If one considers only the number of citable items cited, a citable-items-cited impact factor can be derived to further distinguish between the two journals. In the first case, the citable-items-cited impact factor would be 0.01; in the second, 0.5. Enormous amounts of computer time would be required to derive these different impact factors, although one must acknowledge their potential usefulness. It should be noted also that either of these impact factors can be derived from the other by dividing one of them into the impact factor used in this article.
28. The problem of selecting an items-published base is further complicated by the variety in the kinds of items published in scientific journals. Many journals publish only full-length reports of original research. Many others publish, in addition, editorials, technical communications, letters, notes, general correspondence, scientific news surveys and notes, book reviews, and so on; all of these are potentially citable items. I have not attempted in this article to limit the definition of items-published to lead articles, original communications, or the like. Even assuming it were possible to construct an acceptable classification that would accommodate all of the different kinds of published material, it would have been impossible for me, within the resources available for this article, to have examined individually each of the approximately 600,000 items that I use for the items-published base. If such a differentiation among kinds of material were included in an analysis such as this one, it is reasonable to assume that lead articles in such journals as *Science*, *Nature*, *Lancet*, and *Journal of the American Medical Association* would, as a group, have higher impact factors than those that are shown for these journals in Fig. 8.
29. The percentage (in terms of total citations) of citations of items that are 3 or fewer years old has been, for the years 1964 to 1970, 31.09, 30.24, 26.60, 25.91, 25.32, 25.18, and 23.95, respectively. It is interesting to note that the yearly percentage of such items has gradually decreased as SCI coverage has increased, while the citation rate per cited item has gradually increased (*19*). The significance of these trends is an interesting matter for future investigation.

Journal Citation Analysis and Its Applications

This bibliography is by no means exhaustive. The author has endeavored, however, to include what he believes to be valuable background and useful examples of the application of citation analysis to the study of the sociology of science. Many of the items listed are the author's own work. Their number reflects no exclusive scope or merit of activity, but rather the author's interest and his access to ISI®'s unique data bank. Additional references on citation indexing, citation analysis, and journal evaluation will be found in the paper reprinted as part of this introduction.

JOURNAL RANKING PACKAGE

The Cradle of American Libraries

When you come to Philadelphia you're almost sure to visit Independence Hall where the Declaration of Independence was signed.

But did you know that the Hall also housed from 1740 to 1773 the Library Company, the colonies' first subscription library? Although the Company's share-holders paid expenses, any "civil gentleman" might use the books on the premises—a rule that made the Library Company an important information pool during that turbulent time.

Today the world information pool has turned into a flood. New ideas must be generated to channel relevant and current information to the professionals who need it. Just one block from Independence Hall is the Institute for Scientific Information, where we're pioneering new methods for solving worldwide information problems. We hope you'll use this opportunity to tour our facilities and see how CURRENT CONTENTS®, the SCIENCE CITATION INDEX®, and a variety of other information services are produced.

At ISI®you'll view an orientation film, take a guided tour through important work areas, and get a chance to ask ISI personnel about our operations and services.

ISI tours start at 2 p.m. every Tuesday and Thursday (except holidays). Because the number of places on each tour must be limited, tours will be run on a reservation only basis.

Avoid disappointment—make your reservations now. Use the coupon or phone Inez Holloway at ISI.

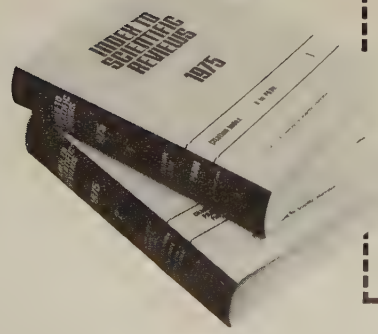
CITING JOURNAL PACKAGE



ANY WAY YOU LOOK AT IT, THIS NEW REFERENCE IS THE PLACE TO LOOK FIRST

. . . because our comprehensive, multidisciplinary *Index to Scientific Reviews*™ will lead you directly to review articles on just about any science subject. And because it's organized so you can find exactly the reviews you need, in several different ways. All of them fast and easy.

Each year *ISR*™ indexes thousands of reviews in some 100 disciplines, from the world's leading science and technology journals. Plus those in the regular "review" publications. And gives you timely twice-a-year coverage through a semi-annual edition and an annual cumulation.

At only $250 per year, ISR is an effective way to cover the journal literature for those who can't afford the major indexes. Or, for those who place a premium on finding review articles with less effort, *ISR* can complement the major indexes.

Just use the coupon below to learn why the new *Index to Scientific Reviews* may be tailor-made for your organization.
